Project Title: *A Multi-Agent Reinforcement Learning Architecture with Independent Sentiment-Anomaly Veto for Pump-and-Dump-Resistant Crypto Trading*

Work Completed During the Week

- Conducted a literature survey across arXiv and IEEE Xplore covering multi-agent RL trading (TradingAgents, MarketSenseAI 2.0, FLAG-Trader, MSPM, MAPS) and FinBERT/LLM-based sentiment trading (FinRL Contests, FinRL-DeepSeek, IEEE 2025 multi-agent crypto trading papers).
- Confirmed, through comparison with recent crypto-manipulation-resistance literature, that no existing system grants the sentiment/anomaly signal independent veto authority over the agents' voting outcome — existing work treats it only as a blended input feature.

Work assigned for next week

- Exploring more such papers to make a strong literature survey.
- Investigate data sourcing options for price/volume history, news/social sentiment, and labeled historical manipulation events.
